

MEDCASE

ume+

MEDCASE is a program for education in medicine that allows you to develop interactive clinical cases in which the doctor and patient are animated characters in a highly-realistic and captivating 3D environment.

It is remarkably true to life thanks to the great attention paid to the characters' non-verbal language (expression and gestures) which are able to express emotions and make incredibly natural movements.

The patient's presentation and dialogue with the physician can be incorporated into a video or used in an interactive clinical case simulation.

MEDCASE allows you to:

- Create any type of doctor-patient dialogue
- Choose and personalize characters (doctor and patient/caregiver)
- Develop clinical cases with different outcomes based on decisions made (branching)
- Implement metrics for the assessment of decisions made (for example assertiveness, medical knowledge etc.)
- Determine goals to be achieved in case simulations (for example informing the patient, making the most correct clinical/diagnostic decisions).
